

Marketing Attribution Project – Detailed Summary

Introduction

This project explains how different marketing channels like Facebook, Google, and Email contribute to customer conversions. It uses attribution models to assign credit to each channel and helps identify which channels are most effective.

Working of the Project

1. Data Collection and Preparation

The dataset includes user interactions with channels, timestamps, and conversion status. The data is cleaned and sorted to ensure proper sequence of user journeys but dataset that provide by you guyz is not enough so I add some columns by using gpt as well

2. User Journey Creation

Each user's interactions are grouped to form a journey, such as Facebook → Google → Email. This helps understand the path taken before conversion.

3. Attribution Models

First-Touch Attribution: Gives full credit to the first channel.

Last-Touch Attribution: Gives full credit to the last channel.

Linear Attribution: Divides credit equally among all channels.

Time-Decay Attribution: Gives more credit to recent interactions.

4. Model Comparison

Results from all models are combined to compare how each channel performs under different attribution methods.

5. Data Visualization

Charts and graphs are created to visually compare channel performance.

6. Dashboard Creation

An interactive dashboard is built to display results and allow easy comparison.

Key Features

- Multiple attribution models
- User journey analysis
- Conversion tracking
- Interactive dashboard

Technologies Used

Python, Pandas, NumPy, Plotly, Dash, Ngrok, Jupyter Notebook

Setup Instructions

1. Install required libraries
2. Add dataset
3. Run notebook
4. Launch dashboard(by using grok)
